## Direct Sums

Let  $V$  be a vector space,  $W_1, \dots, W_r \subseteq V$  subspaces.

**Defn:**  $W_1, \dots, W_r$  are **independent** if  $w_1 = \dots + w_r = 0$ , for  $w_i \in W_i$ , then  $w_i = 0$ .

**Defn:** We let  $W_1 + \dots + W_r = \{w_1 + \dots + w_r \mid w_i \in W_i\}$ .

Observations:

1.  $W_1 + \dots + W_r$  is a subspace.
2. Suppose  $v_1, \dots, v_r \in V$  are nonzero. Put  $W_i = \text{span}(v_i) = \{av_i \mid a \in K\}$ . Then  $W_1, \dots, W_r$  are independent if and only if  $v_1, \dots, v_r$  are linearly independent. Additionally,  $W_1 + \dots + W_r = \text{span}(v_1, \dots, v_r)$ .
3.  $r = 2$ :  $W_1$  and  $W_2$  are independent if and only if  $W_1 \cap W_2 = \{0\}$ .  
Reason: say  $W_1$  and  $W_2$  are independent,  $v \in W_1 \cap W_2$ . Then  $v + (-v) = 0$ , and we have  $v \in W_1$ ,  $-v \in W_2$ . So  $v = 0$ .

**Defn:**  $V$  is the **(internal) direct sum** of  $W_1, \dots, W_r$ , written  $V = W_1 \oplus \dots \oplus W_r$  if  $W_1, \dots, W_r$  are independent and  $W_1 + \dots + W_r = V$ .

Observe:  $V = W_1 \oplus \dots \oplus W_r$  if and only if every  $v \in V$  can be written uniquely in the form  $w_1 + \dots + w_r$ , with  $w_i \in W_i$ .

Reason: suppose  $v = w_1 + w_2 + \dots + w_r = w'_1 + w'_2 + \dots + w'_r$ . Then  $0 = (w_1 - w'_1) + \dots + (w_r - w'_r)$  (each  $w_i - w'_i \in W_i$ ). Because the  $W_i$  are independent, we must have  $w_i - w'_i = 0$ , so  $w_i = w'_i$ .

**Ex:**  $K = \mathbb{C}$ ,  $V = M_{n \times n}(\mathbb{C})$ .  $W_1 = \{m \in V \mid {}^T m = m\}$ ,  $W_2 = \{m \in V \mid {}^T m = -m\}$ .

Claim:  $V = W_1 \oplus W_2$ .

- $V = W_1 + W_2$ : Given  $m \in V$ ,  $m = \left(\frac{m+{}^T m}{2}\right) + \left(\frac{m-{}^T m}{2}\right)$ .  $\frac{m+{}^T m}{2} \in W_1$  and  $\frac{m-{}^T m}{2} \in W_2$ .
- $W_1 \cap W_2 = \{0\}$ . If  $m \in W_1 \cap W_2$ , then  $m = {}^T m = -{}^T m$ . So  $m = 0$ .

Let  $V$  be a vector space, and  $U \subseteq V$  a subspace.

**Defn:** A subspace  $W$  of  $V$  is called a **complement** to  $U$  if  $V = U \oplus W$ .

**Prop:** Every subspace  $U$  has at least one complement.

Proof: Pick a basis  $S$  (possibly infinite) of  $U$ . Extend  $S$  to a basis  $T$  of  $V$ . Define  $W = \text{span}(T \setminus S)$ .

Claim that  $V = U \oplus W$ .

Well,  $V = U + W$ . Let  $v \in V$ . Write  $v = a_1 x_1 + \dots + a_n v_n$ ,  $a_i \in K$ ,  $x_i \in T$ . Assume  $x_i \in S$  for

$1 \leq i \leq k, x_i \in T \setminus S$  for  $k+1 \leq i \leq n$ .

Now, independence. Suppose  $u + w = 0, u \in U, w \in W$ . Write

$$\begin{aligned} u &= a_1x_1 + \cdots + a_nx_n \quad (a_i \in K, x_i \in S) \\ w &= b_1y_1 + \cdots + b_my_m \quad (b_i \in K, y_i \in T \setminus S) \end{aligned}$$

So

$$u + w = a_1x_1 + \cdots + a_nx_n + b_1y_1 + \cdots + b_my_m$$

$T$  is a basis, and  $v_i \in T, w_i \in T$ , so  $a_i = 0$  and  $b_j = 0, \forall i, j$ . So  $u = 0$  and  $w = 0$ .  $\square$

**Ex:**  $V = \mathbb{C}^2, U = \text{span}(\begin{bmatrix} 1 \\ 0 \end{bmatrix}) = \{\begin{bmatrix} a \\ 0 \end{bmatrix} \mid a \in \mathbb{C}\}$ .

Claim: if  $w = \begin{bmatrix} b \\ 1 \end{bmatrix}$ , for any  $b \in \mathbb{C}$ , then  $W = \text{span}(w)$  is a complement of  $U$ .

Reason:  $\begin{bmatrix} 1 \\ 0 \end{bmatrix}, \begin{bmatrix} b \\ 1 \end{bmatrix}$  are a basis for  $\mathbb{C}^2$ .

In fact, any line other than the  $x$ -axis is a complement to  $U$ .

**Prop:**  $V$  is a vector space,  $U, W \subseteq V$  subspaces. Let  $\pi : V \rightarrow V/U$  be the quotient map. Then  $W$  is complement to  $U$  if  $\pi|_W : W \rightarrow V/U$  is an isomorphism.

Proof:  $\ker(\pi|_W) = \{w \in W \mid \pi(w) = 0\} = \{w \in W \mid w \in \ker(\pi)\} = W \cap \ker(\pi) = W \cap U$ .

$\pi|_W$  is injective  $\Leftrightarrow W \cap U = \{0\} \Leftrightarrow W, U$  independent.

Suppose  $\bar{v} \in \text{im}(\pi|_W), \bar{v} = \bar{w}$  where  $w \in W$ . So  $\overline{v-w} = 0$ , thus,  $v-w \in U$ .  $v = w + u$ , with  $w \in W$  and  $u \in U$ . Conversely, if  $v = w + u, w \in W, u \in U$ , then  $\bar{v} = \bar{w}$  because  $\bar{u} = 0$ .

$\text{im}(\pi|_W) = \{\bar{v} \mid v \in U + W\}$ . So  $\pi|_W$  is surjective if and only if  $U + W = V$ .  $\square$

**Cor:** Suppose  $V$  is finite dimensional, and  $U, W$  are complements. Then  $\dim V = \dim U + \dim W$ .

Proof:  $\dim V = \dim U + \dim V/U = \dim U + \dim W$ , because  $W \cong V/U$ .  $\square$

## External Direct Sums

Let  $U$  and  $W$  be vector spaces over  $K$ .

**Defn:** The **(external) direct sum**  $U \oplus W$  is the set of all ordered pairs  $(u, w)$  with  $u \in U, w \in W$ .

The external direct sum is a vector space:

- $(u, w) + (u', w') = (u + u', w + w')$
- $a(u, w) = (au, aw)$

Let  $\bar{u} = \{(u, 0) \mid u \in U\} \subseteq U \oplus W$  and  $\bar{w} = \{(0, w) \mid w \in W\} \subseteq U \oplus W$ .

Then  $U \oplus W$  is the internal direct sum of  $\bar{u}$  and  $\bar{w}$ .

## Linear Transformations

Let  $T : V \rightarrow W$  be a linear transformation.

**Defn:**  $\ker(T) = \{v \in V \mid T(v) = 0\}$ .

**Defn:**  $\text{im}(T) = \{w \in W \mid \exists v \in V \text{ s.t. } T(v) = w\}$ .

Facts:

1.  $\ker(T)$  is a subspace of  $V$ .

2.  $\text{im}(T)$  is a subspace of  $W$ .
3.  $T$  is injective if and only if  $\ker(T) = \{0\}$ .
4. First isomorphism theorem holds:  $T$  induces an isomorphism  $V/\ker(T) \rightarrow \text{im}(T)$ .

**Defn:** Suppose  $V$  is a finite dimensional vector space. The **rank** of  $T$  is  $\dim(\text{im}(T))$ . The **nullity** of  $T$  is  $\dim(\ker(T))$ .

**Thm:** (Rank-Nullity)  $\text{rank}(T) + \text{nullity}(T) = \dim V$ .

Proof:  $\dim V = \dim V/\ker(T) + \dim(\ker(T)) = \dim(\text{im}(T)) + \dim(\ker(T))$ , by the first isomorphism theorem.  $\square$

**Ex:**  $V = P_{\leq d} = \{\text{polynomials of degree } \leq d\}$ ,  $K = \mathbb{C}$ .

$T = \frac{d}{dx} : V \rightarrow V$  is a linear transformation.

$$f \mapsto \frac{df}{dx}$$

Then  $\dim P_{\leq d} = \text{nullity}(T) + \text{rank}(T) = 1 + d = d + 1$ .

Note: if we work over  $\mathbb{F}_p$ , then  $\frac{d}{dx}(x^p) = px^{p-1} = 0$ , so nullity can be greater than 1.

Let  $A$  be an  $n \times m$  matrix (i.e.  $n$  rows,  $m$  columns) over  $K$ . Define a linear transformation  $T_A : K^m \rightarrow K^n$  by  $T_A(v) = Av$ .

**Prop:** Every linear transformation  $T : K^m \rightarrow K^n$  has the form  $T_A$  for a unique matrix  $A$ .

Proof: write

$$A = \begin{bmatrix} | & & | \\ v_1 & \cdots & v_m \\ | & & | \end{bmatrix}$$

with  $v_i \in K^n$ . Then  $T_A(e_i) = v_i$ .

If  $T_A = T_B$ , write

$$B = \begin{bmatrix} | & & | \\ w_1 & \cdots & w_m \\ | & & | \end{bmatrix}$$

$T_A(e_i) = T_B(e_i)$ , so  $v_i = w_i$ . Thus,  $A = B$ .

Given an arbitrary  $T$ , put  $v_i = T(e_i)$  and

$$A = \begin{bmatrix} | & & | \\ v_1 & \cdots & v_m \\ | & & | \end{bmatrix}$$

Then  $T(e_i) = v_i = T_A(e_i)$ , so  $T = T_A$ .

Let  $v = \sum a_i e_i$ . Then  $T(v) = T(\sum a_i e_i) = \sum a_i T(e_i) = \sum a_i T_A(e_i) = T_A(\sum a_i e_i) = T_A(v)$ .  $\square$
